

Question 1:

- a) Error, though this is something that is able to happen and gives meaningful data. I would set all -1 in this column to NaN.
- b) Genuine extreme, I would keep it in the dataset and note it as an outlier.
- c) Inconsistency, I would convert it to the format that every other row is in.
- d) Contamination, I would drop the row.
- e) Inconsistency, I would strip the strings and make them all lowercase.
- f) C and E, a z-score run on a numeric column won't find them because they are in a different format than the rest of the data.
- g) If I ignore that and take out B simply because it is a large value compared to other rows, it could lead to missing out on important data that could inform future decisions.

Question 2:

- a) Yes, $z = 3.611$. The ceiling = 3.615. Z reached 0.999 of the ceiling.
- b) $Q1 = 14$, $Q2 = 15$, $IQR = 1$. Fence 1 = 12.5, Fence 2 = 16.5. Only 100 falls outside of them.
- c) Median = 14, MAD = 1. For 100, M is 58.007 → It is flagged.
- d) The rules cannot tell me what kind of outlier it is, because it is dependent on the situation, however we do know it is a genuine extreme.
